

How one patient becomes a coherence measurement

Every box is a measured quantity from this study. The evidence SET is held fixed throughout; only its ORDER varies.

ONE PATIENT — the evidence set $\{e_1 \dots e_7\}$ never changes ↓

THREE WAYS TO ASK THE SAME MODEL ↓

WHAT EACH AXIOM COMPARES

A1 order invariance	JSD across the 10 orders – JSD across the 6 retests
A2 belief updating	model $\Delta\log$ -odds when a finding is added vs oracle $\Delta\log$ -odds
A3 redundancy	movement caused by evidence the corpus certifies uninformative
A4 positional anchoring	between-position JSD – within-position JSD

REMEDIES COMPARED (Qwen3-32B, paired over cases)

residual = remaining order sensitivity in JSD; lower is better.

A fixed canonical order reaches the same exact zero at -0.012 to $+0.021$ top-1 cost, i.e. free.
The separating quantity is not the residual but the spread ACROSS fixed orders: 0.120–0.258 JSD.
